CASE:

A 20-year-old female comes to your office complaining of severe pain during periods for the past six months. She began menstruating at the age of 13 years. Her last two periods have occurred about 2 months apart without pain or any other symptoms. Since then, she menstruates every 28 days and also notices nausea, diarrhea and headaches during her periods. Her pain is worsened so much so that she has to quit her daily activities.

Q1. What is this clinical condition called?

Q2. What are the common causes of dysmenorrhea

Q3. What is the common cause of Dysmennhorea in a married woman

Q4. Define Polymenorrhea

Q5. What is the diagnosis of this lady?
